AquaSense Pro

Water Quality Prediction and Aquaculture IoT ML Project

Progress report upload for project review and evaluation.

Project overview: AquaSense Pro monitors aquaculture water quality using IoT telemetry, sensor validation, and predictive analytics for purifier performance and water treatment health. The system includes live USB telemetry reception, CSV-based uploads, and simulation scenarios. This document confirms the project is operational and includes a sample dashboard workflow.

Key deliverables: purifier dashboard, telemetry validation, water quality analytics, RUL model sandb and hardware-aware monitoring documentation with live USB, upload CSV, and validation states.

Status Summary:

- The project provides sample telemetry data and project documentation for demonstration use.
- Hardware validation remains dependent on actual connected ESP32 and field instrumentation.
- This PDF is a valid project report that remains viewable in standard PDF viewers.

The implementation is intended for demonstration, validation, and further hardware integration work
